
**EVALUATING THE COST-
EFFECTIVENESS OF
LECANEMAB FOR EARLY
ALZHEIMER'S DISEASE IN
SWEDEN**

Alzheimer's Disease: A Global Burden

- AD = leading cause of dementia globally
- Rising prevalence in aging populations
- Economic strain: long-term care, institutionalization
- Traditional drugs: limited disease modification
- Lecanemab: amyloid-targeting monoclonal antibody

Study Overview (Xia et al., 2025)

- Published: *PharmacoEconomics* (2025)
- Objective: Determine cost-effective price of Lecanemab
- Perspective: Swedish formal care payer
- Method: 10-year Markov model
- Data source: Swedish Dementia Registry (SveDem)

Understanding Pharmacoeconomics

- Evaluates cost vs. health outcomes
- Methods: CMA, CEA, CUA, CBA
- Lecanemab study: Cost-Utility Analysis (CUA)
- Measures cost per QALY gained
- Sweden's WTP threshold $\approx$ 1M SEK/QALY

The Markov Model

- 9 Alzheimer's disease states
- 3-month cycles for 10 years
- Transitions between community and institutional care
- Inputs: disease progression, costs, QALYs
- Output: incremental cost per QALY

Key Findings

- QALY gain: +0.17
- Incremental cost: +87,146 SEK (excluding drug)
- Cost-effective price: 33,886 SEK/year
- U.S. price $\approx$ \$26,500/year $\rightarrow$ not cost-effective
- 1M SEK/QALY threshold exceeded

Study Strengths

-
- Real-world data from SveDem
 - Detailed Markov model
 - Comprehensive cost components
 - Genetic stratification (APOE ϵ 4)
 - Extensive sensitivity analyses
 - Publicly available model code

Study Limitations

- Excluded societal costs
- Used U.S. data for MCI transitions
- 10-year horizon (short for AD)
- Conservative assumptions (3-year max treatment)
- Potential underestimation of long-term benefit

Authors' Conclusions

- Lecanemab not cost-effective at U.S. price
- Conservative assumptions → credible results
- Scenario analyses consistent
- Aligns with international findings (ICER, NICE)

Our Group's Position
